

When managing any space, whether large or small, it is important to understand when, and how much it is being used. This information is useful for all manner of reasons such as evaluation of completed projects, analysis of usage patterns, assessment of future needs. Have you considered how a counter could help you?

Healthmatic Footfall Counters

Our counting solutions offer a variety of sensors to gather footfall data. This data is stored locally and transmitted once per day via GPRS modem to our data centre, whereupon you can view it via our easy to use online portal. Unlike other suppliers, we're not tied to a particular counting hardware, meaning we can offer you the solution and sensor that will fit your needs the best.

COUNTER OPTIONS

PIR SENSOR COUNTERS

Our PIRS have been in use for over 10 years across the UK and Ireland, with over 1500 systems installed on behalf of public bodies including the Canal Trust in the UK and the RSPB. These counters are waterproof up to IP65 and are perfect for measuring footfall outdoors, such as on public footpaths. The PIR registers counts via passive infrared, detecting changes in body heat to record a count.

RADIO BEAM

The radio beam units enable us to pick up counts over a greater gap which is the best solution when counting Car Park entrances, roads and any areas where the distance between the sensors could be quite large. Dual frequency units can discriminate between pedestrians, vehicles and bicycles meaning these units are ideal for Car Parks, road entrances, shopping centres and many other applications.

PERSONALISED WEB PORTAL

The sensor and data logger are installed alongside our latest GN7 module with a built-in GPRS modem. The system is set up to transmit the data to Healthmatic data centres on a daily basis or agreed frequency, and the information is made available to you via our easy to use web portal. In the office, we run an exception report every morning that checks for errors and erroneous counts, meaning that we can send out an engineer to fix any faults that occur.

MAINTENANCE

We have a team of engineers based all over the UK and Ireland, who are responsible for the maintenance of all our counters in the field.
